## 1. Boundaries of the process

AtliQ Contract Risk Analyzer. Opportunity Map.

**INPUT: what triggers it**

A contract draft arrives, usually from a client or partner on *their* template; sometimes AtliQ's own draft going to an agency or freelancer. Arrives by email or WhatsApp to a seller or to Karandeep.

**OUTPUT: what counts as done**

Signed, or rejected. Lifecycle kept simple as the brief asks: received, reviewed, negotiated, signed or rejected.

**Stated simplifications**

- One intake point: the contract is uploaded or forwarded once
- Terms agreed on phone or WhatsApp are outside the map (roadmap item)
- Partner and client contracts are the subject, as the client scoped it; AtliQ's own paper to agencies and freelancers gets the mutuality and paperwork checks only, as an explicit extension
- English-language contracts only in V1

## 2. The canvas: eight steps, three rows each

Yellow = the step. Green = actions by human today. Lavender = digital tools in use. Red = pain points.

| Step | 1 Receive and log<br>Draft lands in an inbox; tracker row added, sometimes | 2 Triage and queue<br>Which contract first; waiting for a free evening | 3 Read every clause<br>Clause by clause on the other side's paper | 4 Check past promises<br>Does anything already signed conflict? | 5 Entity, country, rules, paperwork<br>Right entity, law, courts and documents | 6 Decide on unsure clauses<br>Peers, contacts, research, or paid counsel | 7 Negotiate<br>Redlines back and forth by email | 8 Sign or reject, then file<br>Signature; the new promises vanish into email |
|---|---|---|---|---|---|---|---|---|
| Actions by human | 1. Seller receives draft by email / WhatsApp<br>2. Checks scope vs proposal only<br>3. Forwards to KD's inbox<br>4. Adds tracker row, sometimes<br>5. Promises the client a date | 1. KD picks the next one when free, after BAU work<br>2. Sellers chase on client deadlines<br>3. KD occasionally hands a review to a seller<br>4. No order, owner or deadline agreed | 1. Reads the whole document<br>2. Hunts for checklist clauses: LDs, liability, indemnity, payment, law, IP, termination<br>3. Judges each from memory<br>4. Checks SOW vs proposal<br>5. Signs "mutual" NDAs on sight<br>6. Under deadline: skims, "looks standard, signing now" | 1. Tries to remember earlier restrictions<br>2. Asks project leads and co-founders<br>3. Searches email and drives<br>4. Opens old contracts one by one; checks expiry<br>5. Checks which entity signed; affiliate wording<br>6. If unsure, sends to counsel | 1. Reads parties clause for the entity<br>2. Checks governing law and courts<br>3. Works out from experience which documents the deal needs (NDA, BAA, DPA, matching vendor terms)<br>4. Checks insurance and other numbers<br>5. Usually skipped under deadline | 1. Looks for a similar past case<br>2. Asks the founders<br>3. Asks trusted contacts; researches online<br>4. If big enough, briefs counsel and gathers documents<br>5. Accept, push back, or walk away | 1. KD or seller writes back with changes<br>2. Counters from memory of past positions<br>3. Accepts non-negotiables or walks away (Kessler)<br>4. Several rounds by email | 1. KD signs, sometimes from a phone at an airport<br>2. Saves the copy wherever he is<br>3. Updates tracker, sometimes<br>4. Nobody extracts what was just promised |
| Digital tools in use | Email. WhatsApp. contract_tracker.csv (a seller's 2025 spreadsheet). Shared drive, laptops, KD's inbox as the real filing system. | None. A whiteboard list at the 22 Sep meeting. | PDF reader or phone screen. Google Keep for the 2024 checklist. Nothing else. | Email search. Shared drive "loosely sorted by domain and region". Memory. | Finance's entity fact sheet ("nobody outside finance reads this"). Tracker notes. | Old email threads with redlines. Phone. Counsel by email. | Email redlines. Word track changes on the counterparty's file. | Email attachments. Shared drive. One scanned PDF with OCR errors. |
| Pain points | • Tracker: blanks, a duplicate, stale statuses, entity often blank<br>• Files "in KD's email", "a founder's laptop", or nowhere<br>• Deadlines only in the notes column | • About a week in queue; a batch waits for free evenings<br>• ShopSwift: 9 days, budget slipped a quarter<br>• Three people chased on one morning<br>• ~9 a month (3-4 contracts, 4-5 NDAs), seasonal | • 3-4 hours per client MSA<br>• Every contract is a new contract<br>• Ruinous clauses read like boilerplate late in the evening<br>• "Mutual" is not always mutual<br>• AtliQ's own template carries clauses it rejects as supplier<br>• Checklist 2 years old, "never complete" | • No list of what AtliQ promised not to do<br>• Al Noor took 20 min to find on a paid call; entity and affiliate scope unknown<br>• Non-competes, exclusivity, MFN pricing, IP, consents: all scattered<br>• Counsel wants ALL such contracts first<br>• A miss = breach with an existing client | • Wrong entity or foreign law signed at least once; two payment delays in 2025<br>• Documents a deal needs tracked nowhere<br>• Harrington patient data reached Pune before any BAA<br>• BAA wants $5M cover, AtliQ holds $1M, not raised<br>• Rules differ by region; no fixed checklist exists | • Past positions live in old threads; "the why is only in K's head"<br>• A one-off exception looks like policy on paper<br>• Counsel: 5-7 working days, collides with client dates<br>• Routine questions go to counsel for lack of anywhere else | • Every negotiation starts from scratch<br>• Consistency depends on who is tired<br>• Phone-call commitments leave no record<br>• Sellers cannot see progress | • New restrictions invisible until they bite<br>• Signed files scattered: 17 of ~30 found<br>• Expiry of restrictions tracked nowhere |

## 3. Redesign with AI cards: Steps 3, 4, 5 and 6

### Step 3: Read every clause

AI READS AND WRITES
**AI summarises text**
Reads the whole contract and restates each clause in one plain-English line: 40 clauses scanned in minutes, not 20 pages read.

AI FINDS AND ORGANISES INFORMATION
**AI finds one specific piece of information**
Finds the clauses that matter wherever they hide, however worded: delay penalties, liability caps, indemnity, payment, law, IP, termination, non-compete, exclusivity, pricing promises, insurance.

AI FINDS AND ORGANISES INFORMATION
**AI sorts information into groups**
Categorises every clause and gives it a verdict: fine / needs attention / conflict. Checks whether a clause labelled "mutual" really binds both sides.

AI MAKES DECISIONS AND RECOMMENDATIONS
**AI recommends actions**
Suggests sign / negotiate (with clauses to push on) / escalate. A suggestion only. The human decides.

Upload a contract and get, in minutes, a clause-by-clause table with a verdict and a quoted reason for each, a mutuality check, and a suggested next step.

STEP 1, LIGHT CHANGE
**AI organises data into spreadsheets**
On upload, creates the tracker row automatically (counterparty, type, entity guess, dates, value) so the log is never blank.

### Step 4: Check past promises

AI FINDS AND ORGANISES INFORMATION
**AI organises data from emails and notes into spreadsheets**
Reads every signed contract once and extracts each binding promise into a register: type, scope, region, sector, entity, expiry, quoted clause. Karandeep confirms each row.

AI FINDS AND ORGANISES INFORMATION
**AI finds all relevant information**
For an incoming deal, finds every register entry that could touch it: region, sector, counterparty, affiliate wording, dates.

AI FINDS AND ORGANISES INFORMATION
**AI shows the connection between different data**
Links the new clause to the old one and explains the collision: "Gulf Crown is a Saudi hotel group; Al Noor s.12 restricts hospitality analytics in the GCC until 18 months after term and binds affiliates, so AtliQ Inc is caught too."

Before anyone reads the new contract, the reviewer sees every existing commitment it could breach, clause quoted and file named, or a clear "no conflicts found against the N commitments on the register".

STEP 2, LIGHT CHANGE: JOKER, RULES
**Queue status visible to sellers**
Sellers see where their contract is and who is reviewing it. No AI needed. Ordering by deadline and value is deferred.

### Step 5: Entity, country, rules, paperwork

AI FINDS AND ORGANISES INFORMATION
**AI finds one specific piece of information**
Extracts from the draft the facts the rules need: parties, AtliQ entity, counterparty country, governing law, courts, currency, data types (personal, patient), insurance figures.

JOKER CARD
**Rules, no AI**
A lookup table, not a model: entity to country to law and courts; deal type and region to documents required; numeric requirements vs what AtliQ holds. Flags "regulated region or data type: confirm with counsel" rather than claiming to know the law.

Every review states which entity should sign, whether the law and courts fit, which documents the deal needs and which are missing, and any numeric gap such as insurance cover.

STEP 8, LIGHT CHANGE
**AI organises data into spreadsheets**
On signature, extracts the new commitments and their expiry into the register. This is what keeps Step 4 alive.

### Step 6: Decide on unsure clauses

AI FINDS AND ORGANISES INFORMATION
**AI finds all relevant information**
For each clause needing attention, finds what AtliQ did last time on a similar clause: asked for, conceded, walked away from, with the deal named.

AI READS AND WRITES
**AI summarises text**
Writes the one-page review brief that pulls Steps 3, 4 and 5 together; if escalation is suggested, packages the brief with the relevant documents for counsel.

The reviewer decides with the history in front of them instead of in their memory, and counsel starts from a package instead of a 20-minute hunt.

STEP 7, DEFERRED
**AI writes text / creates content**
Counter-proposal drafting from precedent. Later: depends on 3-6 working first, and the client said positions are judgment calls, so drafting must never look like policy.

## 4. What is left with the human, and what the AI introduces

**New actions by human**

1. Reads every clause marked "attention" or "conflict" in full, with the quoted text
2. Spot-checks a sample of the "fine" clauses (about 1 in 5) instead of re-reading everything
3. Confirms or corrects each register entry when the register is first built, and each new entry after a signature
4. Confirms the suggested next step or overrides it; every override is recorded with a reason
5. Decides the negotiation position; the brief shows history, it never sets the number
6. Keeps the rules table current (entities, regions, document checklist)
7. Signs

**New pain points introduced by AI**

- False alarm: a clause flagged that is not a problem. "Raising the alarm on everything teaches people to stop listening"
- False negative: a dangerous clause marked "fine". Worse than today because the reviewer now trusts the brief
- A conflict reported against a stale, expired or mis-extracted register entry
- The model invents a clause, a precedent or a legal rule
- Precedent read as policy (Al Noor's 10% cap was a one-off)
- Confidential contracts sent to a model API
- Over-reliance: "the AI said it was fine"
- Cost and speed on long contracts: a 20-page MSA is not a chat message

## 5. Guardrails: cards and written commitments

**Human augmentation, human control**
A named reviewer reads every "attention" and "conflict" item and samples the "fine" items. The AI never signs, approves or sends. Every override of a suggestion is logged with a reason: the audit trail.

**Accountability (as an SLA)**
Karandeep, or the reviewer he delegates to, is accountable for every decision. SLA: every uploaded contract reaches a decision within 1 working day. A missed conflict that reaches signature triggers a register review within 1 week.

**Explainability**
Every finding quotes the clause and names its source: contract, register entry or precedent. When support cannot be found it says "not found". It reports which checks passed, never "this contract is safe".

**Human privacy, data and system security**
Contracts are confidential. Personal names and client identifiers are masked before any model call on real contracts. Vendor terms must exclude training on AtliQ data. Role-based access; Karandeep is super-admin; reviewers see only what they are entitled to.

**Fairness (both directions)**
The mutuality check runs on AtliQ's own paper too, so a 12-person agency does not receive the clauses AtliQ rejects as a supplier.

**No misuse**
The tool reviews contracts for AtliQ's own decision. Not used to generate terms designed to disadvantage a smaller counterparty; not used on contracts AtliQ is not party to.

**AI identifies itself**
Every brief carries the label: "AI-generated draft review. Not legal advice. A person decides."
